1 **I. INTRODUCTION**

2 The circumstances leading to commencement of this suit by Gen-Probe Incorporated (“Gen-  
3 Probe”) require close scrutiny of its myriad allegations that the patent in suit, owned by Vysis Inc.  
4 (“Vysis”), is invalid and not infringed. Having failed to appreciate the value of the present invention  
5 until after Vysis suggested its value to Gen-Probe in 1994, having thereafter adopted the patented  
6 technology as solving the problems that Gen-Probe itself concedes had been the “Achilles’ heel” of  
7 earlier assay products, having insisted that it be granted a license under the Vysis patent as a  
8 condition to settlement of prior unrelated litigation between the parties, and having to this day  
9 scrupulously preserved for itself the protections provided by the license, Gen-Probe now comes  
10 before this Court seeking to avoid its obligations to pay royalties under that license agreement. Gen-  
11 Probe does so by presenting a series of factual and legal contentions that are irreconcilable with its  
12 own conduct, the clear prosecution history of the patent in suit, and well settled patent law.

13 The allegations upon which Gen-Probe’s present motion for summary judgment is based  
14 cannot withstand close scrutiny. Gen-Probe asks this Court to read into the Vysis patent claims a  
15 requirement for non-specific amplification. Yet, when the available intrinsic evidence that must be  
16 considered in all matters of claim construction – the claims, the patent specification, and the  
17 prosecution history – point unambiguously in the other direction. The text of the patent makes  
18 specific reference to “specially tailored primers” of the sort used in specific amplification processes,  
19 the patent owner stated repeatedly during prosecution leading to issuance of the patent that “[t]argets  
20 can be amplified by a number of ways including PCR,” which is perhaps the most notorious specific  
21 amplification technique of all, and the U.S. Patent and Trademark Office (PTO) specifically stated in  
22 its reasons for allowance of the patent that it related to “PCR amplification.” A fatal flaw in Gen-  
23 Probe’s motion is the complete failure even to address the prosecution history of the patent. Much  
24 of the material offered by Gen-Probe in support of its position falls instead into the category of  
25 “extrinsic” evidence, including alleged evidence of the inventors’ subjective intent, which the  
26 Federal Circuit has repeatedly indicated should not be considered on the issue of claim construction.  
27 Under these circumstances, Gen-Probe’s suggestion that the patent claims should be read in a way  
28

09533906 DEPT 202120

1 that would exclude specific amplification techniques, such as PCR, borders on the frivolous and  
2 must be rejected as a matter of law.

3 **II. THE CLAIMS OF THE '338 PATENT ARE NOT LIMITED TO NON-SPECIFIC**  
4 **AMPLIFICATION**

5 **A. Claim Construction Requires Review of the Prosecution History of the Patent**

6 In its effort to ignore the prosecution history of the patent in suit -- U.S. Patent No. 5,750,338  
7 ("the '338 patent") -- Gen-Probe badly misstates the law applicable to claim construction. Citing  
8 *Vitronics Corp. v. Conceptor, Inc.*, 90 F.3d 1576, 1582 (Fed. Cir. 1996), Gen-Probe makes the  
9 following statement in its memorandum:

10 In determining the proper construction of a claim, the Court has numerous  
11 sources that it may properly utilize for guidance. Cite omitted. These sources include  
12 both "intrinsic" evidence (e.g., the patent specification) and "extrinsic" evidence (e.g.,  
13 expert testimony and the inventor's/patent owner's own descriptions of the invention).

14 Gen-Probe Memorandum ("Memo.") at 8.

15 Gen-Probe's statement of the applicable law is a gross mischaracterization of what the  
16 *Vitronics* court actually said. The court said:

17 In determining the proper construction of a claim, the court has numerous  
18 sources that it may properly utilize for guidance. These sources . . . include both  
19 intrinsic evidence (e.g., the patent specification **and file history**) and extrinsic  
20 evidence (e.g., expert testimony).

21 *Id.* (emphasis added). The *Vitronics* court went on to state that the prosecution (or file)  
22 history "is often of **critical significance** in determining the meaning of the claims." *Id.* (emphasis  
23 added). Indeed, the *Vitronics* court concluded that "it is **improper** to rely on extrinsic evidence"  
24 when "the intrinsic evidence alone will resolve any ambiguity in a disputed claim term." *Id.* at 1583  
25 (emphasis added).<sup>1</sup>

26 <sup>1</sup> In a further attempt to obscure the importance of the prosecution history to claim  
27 construction, Gen-Probe, at page 13 of its Memo, also crops a quote from *Wright Medical*  
28 *Technology, Inc. v. Osteonics Corp.*, 122 F.3d 1440, 1443 (Fed. Cir. 1997). Gen-Probe quotes from  
the case: "The proper construction of the claims is based upon the claim language, the written  
description portion of the specification including any relevant drawings . . ." but omits the court's  
reference to the "prosecution history."

09533906.021202

1 The Federal Circuit's seminal claim construction case of *Markman v. Westview Instruments,*  
2 *Inc.*, 52 F.3d 967, 979 (Fed. Cir. 1995), *aff'd*, 517 U.S. 370 (1996), held that a patent's prosecution  
3 history "is of **primary significance** in understanding the claims." (Emphasis added.) Indeed, the  
4 Federal Circuit has stated that the failure to consider the prosecution history during claim  
5 construction is error. *Lemelson v. United States*, 752 F.2d 1538, 1550 (Fed. Cir. 1985).

6 This Court, citing *Markman*, has recognized that courts **must** consider the prosecution  
7 history, if in evidence, when construing patent claims, along with the claims themselves and the  
8 specification. *Lee's Aquarium & Pet Products, Inc. v. Python Pet Products, Inc.*, 951 F. Supp. 1469,  
9 1472 (S.D. Cal. 1997), *aff'd*, 152 F.3d 945 (Fed. Cir. 1998). In that case, this Court also agreed with  
10 *Vitronics* that it is improper for the court to rely on extrinsic evidence if an analysis of the intrinsic  
11 evidence (claim language, specification, and prosecution history) resolves any ambiguity. *Id.*

12 The Federal Circuit in *Markman* eloquently explained why the type of evidence offered by  
13 Gen-Probe has little or no weight in determining the scope of a claim and why the prosecution  
14 history of a patent is intrinsic evidence that must be considered in claim construction:

15 No inquiry as to the subjective intent of the applicant or PTO is appropriate or  
16 even possible in the context of a patent infringement suit. The **subjective intent of**  
17 **the inventor** when he used a particular term **is of little or no probative weight** in  
18 determining the scope of a claim (**except as documented in the prosecution**  
19 **history**). . . . While presumably the inventor has approved any changes to the claim  
20 scope that have occurred via amendment during the prosecution process, **it is not**  
21 **unusual for there to be a significant difference between what an inventor thinks**  
22 **his patented invention is and what the ultimate scope of the claims is after**  
23 **allowance by the PTO.** [Citation omitted.] Of course the views of the other party to  
24 the "patent contract," the government, are generally not obtainable, **except as**  
25 **reflected in the prosecution history.** . . .

26 Moreover, ideally there should be no "ambiguity" in claim language to one of  
27 ordinary skill in the art that would require resort to evidence outside the specification  
28 and prosecution history. . . . Patent applications, unlike contracts, are reviewed by  
patent examiners, quasi-judicial officials trained in the law and presumed to "have  
some expertise in interpreting the [prior art] references and to be familiar from their  
work with the level of skill in the art and whose duty it is to issue only valid patents."  
[Citations omitted.] **If the patent's claims are sufficiently unambiguous for the**  
**PTO, there should exist no factual ambiguity when those same claims are later**  
**construed by a court of law in an infringement action.**

26 *Markman*, 52 F.3d at 985-86 (emphasis added).

1 Gen-Probe completely ignores the clear pronouncements in these binding precedents that the  
2 prosecution history is intrinsic evidence that must be considered in determining the meaning of a  
3 patent claim and instead relies heavily on the inventor's/patent owner's recollections of the invention  
4 that the courts have held are extrinsic evidence not normally considered in claim construction. Why  
5 Gen-Probe did this is clear. An examination of the prosecution history of the '338 patent  
6 unambiguously establishes that the PTO and the patent owner both believed that specific  
7 amplification was included in the invention claimed by the '338 patent, which is fatal to Gen-Probe's  
8 motion.

9 **B. The Prosecution History Belies Gen-Probe's Asserted Claim Construction**

10 The claims of the '338 patent are directed to methods or kits for amplifying or detecting a  
11 target polynucleotide in a sample by combining the techniques of target capture with amplification.  
12 As Gen-Probe correctly points out in its memorandum, the claims include the step of "amplifying"  
13 the target polynucleotide. Gen-Probe argues that the proper meaning of the term "amplifying" in the  
14 claims is limited to non-specific amplification. The prosecution history of the '338 patent, however,  
15 unambiguously belies Gen-Probe's contention.

16 The prosecution history of the '338 patent, the history of the correspondence between the  
17 patent owner and the PTO, leads to the inescapable conclusion that both the patent owner and the  
18 PTO (no fewer than five different Patent Office Examiners) considered the claimed invention to  
19 encompass the polymerase chain reaction ("PCR"), which is a type of specific amplification.<sup>2</sup>

20 The initial application for the '338 patent included a broad claim (claim 1), which recited the  
21 step of "subjecting said removal product to amplification . . ." Exhibit ("Ex.") A to Declaration of  
22 Thomas W. Banks in Support of Vysis' Opposition to Gen-Probe's Motion for Partial Summary  
23 Judgment ("Banks Decl."), p. 61.<sup>3</sup> In rejecting the claims of the original '338 patent application in  
24

25 <sup>2</sup> The following discussion of the prosecution history is based primarily on the Declaration  
26 of David H. Persing In Support Of Vysis' Opposition To Gen-Probe's Motion For Partial Summary  
27 Judgment ("Persing Decl.").

28 <sup>3</sup> It is noteworthy in this regard that original dependent claim 11 contained language  
specifically further limiting the claim to "non-specific" amplification, which language was never  
incorporated into the broad claims. Banks Decl., Ex. A. The patent owner clearly knew how to  
exclude the disclosed use of specific amplification had it wanted to, but did not.

09533906-021202

1 the PTO's first Official Action, Patent Examiner Scott A. Chambers, Ph.D, and Primary Patent  
2 Examiner Amelia Burgess Yarbrough cited as prior art the basic Mullis PCR patents. Banks Decl.,  
3 Ex. B, pp. 3-4. Clearly, if the Patent Examiners had believed that the claims of the '338 patent  
4 application were limited to non-specific amplification, it would have been illogical for them to have  
5 cited the PCR patents against the application, because PCR is a type of specific amplification.  
6 Thereafter, Examiner Chambers and Primary Examiner Margaret Moskowitz continued to cite the  
7 Mullis PCR patents against the pending patent claims. Banks Decl., Ex. C, p.3, and Ex. D, p.3.

8 In responding to rejections of the pending claims based on the Mullis PCR patents, the owner  
9 of the '338 patent never attempted to distinguish the Mullis patents by arguing that Mullis disclosed  
10 specific amplification, whereas the invention of the '338 patent was directed to non-specific  
11 amplification. To the contrary, the patent owner repeatedly emphasized that the invention included  
12 PCR-type amplification:

13 Applicant's invention principally serves to enhance the sensitivity of nucleic acid  
14 hybridization assays utilizing target amplification. **Targets can be amplified by**  
15 **a number of ways including PCR.** Applicant's invention enhances sensitivity  
16 by eliminating from the amplification medium extraneous (nonspecific) nucleic  
17 acids which might otherwise be amplified by PCR thereby introducing noise into  
18 the assay.

19 Banks Decl., Ex. E, p.18 (responding to November 5, 1992 Office Action in application serial no.  
20 07/944,505) (emphasis added).

21 If the patent owner had considered the invention to be limited to non-specific types of  
22 amplification, it undoubtedly would have argued this to the PTO to overcome the rejection of the  
23 patent claims based on the Mullis PCR patents, which disclosed specific amplification. Instead, the  
24 patent owner maintained all along that the invention encompassed PCR and argued that the invention  
25 was not obvious in view of the PCR patents. Persing Decl., ¶ 16.

26 The official recognition that the '338 patent claims encompassed specific amplification  
27 techniques like PCR persisted through the very end of the patent procurement process. Indeed,  
28 Patent Examiner Dianne Rees, Ph.D., and Primary Patent Examiner W. Gary Jones make it clear in  
the very first sentence of their Examiner's Statement of Reasons for Allowance that they considered  
the claims of the '338 patent to encompass specific amplification techniques such as PCR:

1 The claims are drawn to methods of **PCR amplification** wherein the target is  
2 first separated from the sample by using a support that binds to the target  
3 polynucleotide and then amplified.

3 Banks Decl., Ex. F, p.2 (emphasis added).

4 The only reasonable conclusion to be reached upon reading the prosecution history of the  
5 '338 patent is that both the patent owner and the five patent examiners who examined the patent  
6 application believed that the term "amplify" in the patent claims included specific amplification.

7 Persing Decl., ¶ 18.

8 If the PTO's views from the original prosecution history were not enough, the PTO has  
9 adhered to these views in reissue proceedings. In its Protest to Vysis' reissue application for the  
10 '338 patent, Gen-Probe presented to the PTO the argument set forth in this motion that the  
11 specification of the '338 patent does not provide a basis for claiming specific amplification after  
12 target capture. The PTO has indicated that it disagrees with Gen-Probe's interpretation of the '338  
13 patent, stating in a January 16, 2001 Interview Summary that "the specification [of the '338 patent]  
14 provided basis for both specific and non-specific amplification of targets subsequent to capture."

15 Banks Decl., Ex. G, pp. 3-4.

16 The Federal Circuit has made it clear that the Patent Examiner's understanding of the  
17 meaning of patent claims developed during prosecution is relevant to construing the proper scope  
18 and meaning of those terms. *Markman*, 52 F.3d. at 983 ("It is evident from Markman's explanation  
19 of the claims to the examiner that he used 'inventory' in the patent and the examiner understood  
20 'inventory' to consist of 'articles of clothing.'"); *Toro Co. v. White Consolidated Indus., Inc.*, 199  
21 F.3d 1295, 1299 (Fed. Cir. 1999) ("Determining the limits of a patent claim requires understanding  
22 its terms in the context in which they were used by the inventor, considered by the examiner, and  
23 understood in the field of the invention.").

24 Federal District Courts, including this Court, have followed the Federal Circuit's direction  
25 and relied on the meaning of claim terms adopted by the PTO during patent prosecution in  
26 construing the meaning of patent claims. *Synthes v. Depuy Ace Medical Co.*, 1999 U.S. Dist. LEXIS  
27 18173, \*12-16 (E.D. Pa. 1999) (court declined to construe patent claim terms narrowly because  
28 Patent Examiner had rejected the claims based on prior art that met those terms only if construed

1 broadly); *Sport Squeeze, Inc. v. Pro-Innovative Concepts, Inc.*, 51 U.S.P.Q.2d 1764, 1769 (S.D. Cal.  
2 1999) (“the prosecution history of all three patents reveals that both [the inventor] and the patent  
3 examiner understood that differing particle sizes were significant in light of [the prior art]”).

4 Here, the case is even stronger than in *Synthes* for refusing the proffered narrow construction  
5 of the disputed claim language. The Patent Examiners of the ‘338 patent application rejected the  
6 claims in view of prior art disclosing the very embodiment, specific amplification, that Gen-Probe  
7 contends should not be included within the term “amplify.” The patent owner, in response,  
8 explicitly acknowledged that the claims encompassed specific amplification techniques, such as  
9 PCR. Moreover, in the very **Reasons for Allowance** of the claims of the ‘338 patent, the PTO  
10 Examiners clearly stated their position that the claims included specific amplification, such as PCR.

11 The prosecution history of the ‘338 patent makes it clear that not only the patent owner but  
12 also the PTO considered specific amplification as included within the claimed term “amplify.” As  
13 the Federal Circuit observed in *Markman*, “[i]f the patent’s claims are sufficiently unambiguous for  
14 the PTO, there should exist no factual ambiguity when those same claims are later construed by a  
15 court of law in an infringement action.” *Markman*, 52 F.3d at 986.

16 **C. The Specification of the ‘338 Patent Does Not Limit the Claims to Methods**  
17 **Using Non-Specific Amplification**

18 The reason for this unambiguous construction of the patent claims during prosecution as  
19 encompassing specific amplification becomes clear from a review of the patent specification. As  
20 pointed out in detail below, the specification of the ‘338 patent describes as one of the particular  
21 benefits of the invention that it **permits** the use of non-specific amplification. Gen-Probe, however,  
22 points to nothing in the ‘338 specification that in any way states that non-specific amplification is the  
23 invention or **must** be used.

24  
25  
26  
27  
28

1                   1.       **The '338 Patent Specification**

2                   The primary discussion of the invention of combining target capture with amplification  
3 begins at column 30, line 15 of the '338 patent specification.<sup>4</sup> The invention is first defined broadly  
4 by the statement that “[t]he sensitivity of the above DNA or RNA target capture methods can be  
5 enhanced by **amplifying** the captured nucleic acids.” (Emphasis added.) The specification then  
6 describes a particular benefit of the invention, that “[t]his **can be achieved** by non-specific  
7 replication using standard enzymes . . . .” (Emphasis added.) The specification does **not** say that  
8 enhanced sensitivity of the target capture methods is achieved by non-specific amplification, but  
9 rather uses **permissive** language, i.e., that enhanced sensitivity **can be achieved** by non-specific  
10 amplification.

11                   The specification then again describes the invention as including amplification generally in  
12 the paragraph at column 30, lines 23-29. The paragraph following this describes both specific and  
13 non-specific amplification, but points out the particular benefits of the invention when using non-  
14 specific amplification:

15                   Amplification of the target nucleic acid sequences, because it follows purification of  
16 the target sequences, **can** employ non-specific enzymes or primers (i.e. enzymes or  
17 primers which are capable of causing the replication of virtually any nucleic acid  
18 sequence). Although any background, non-target, nucleic acids are replicated along  
19 with target, this is not a problem because most of the background nucleic acids have  
20 been removed in the course of the capture process. Thus **no specially tailored**  
21 **primers are needed** for each test, and the same standard amplification reagents can  
22 be used, regardless of the targets.

23                   Col. 30, lines 30-40 (emphasis added).

24                   The reference to “specially tailored primers” is an explicit reference to specific amplification  
25 techniques. The specification does not say that such specific techniques cannot be used. Rather, the  
26 ‘338 specification simply shows that the use of target capture in accordance with the invention  
27 **makes it possible** to use non-specific primers (i.e., non-specific amplification). Without target  
28 capture prior to amplification, non-specific amplification would not be a viable technique for

---

27                   <sup>4</sup> The following description of the specification of the '338 patent is based on the Persing  
28 Declaration.

1 detecting target nucleic acids in a sample because non-specific amplification causes the replication  
2 of virtually any nucleic acid sequence. However, this is not a problem because the invention of the  
3 '338 patent provides a target capture step that removes background, non-target nucleic acids from  
4 the sample prior to amplification. The specification does not state that one would not want to use  
5 specially tailored primers, but only that such primers are **not needed** in this invention. Thus, the  
6 specification simply discloses an important advantage of the invention, that is, because of the  
7 preceding target capture step, either specific or non-specific amplification can be successfully used  
8 in nucleic acid detection assays; whereas without the invention, only specific amplification could be  
9 used. Persing Decl., ¶ 11.

10 The disclosure at column 30, lines 15-40 of the '338 patent specification tells those of  
11 ordinary skill in the art that, while the use of target capture made it possible to use non-specific  
12 amplification in assays for detecting nucleic acids, the invention was more generally directed to the  
13 use of target capture prior to either specific or non-specific amplification. The benefits of the  
14 invention, i.e., purifying the sample by removing non-target materials such as contaminants and  
15 inhibitors that can interfere with the amplification step, would also be obtained with specific  
16 amplification. If the inventors had wanted to limit the invention to non-specific amplification, it is  
17 difficult to imagine that they would have drafted the specification as they did. Persing Decl., ¶ 12.

18 Gen-Probe acknowledges, as it must, the **permissive** rather than **mandatory** disclosure of the  
19 '338 patent specification regarding non-specific amplification:

20 The inventors . . . pointed out that one of the express benefits of their  
21 invention was that it **permitted** the use of non-specific enzymes and non-specific  
22 primers.

23 Memo, p. 11.

24 Gen-Probe argues that the examples of the '338 patent disclose only non-specific  
25 amplification and relies on the declaration of Dr. Joseph Falkinham, wherein he stated that "the  
26 primers described in the ['338] patent are not pre-selected to bind to specific nucleotide sequences as  
27 part of the amplification process" and that Example 5 describes only non-specific amplification.

28 Memo, pp. 11-12, and Falkinham Declaration ("Decl."), ¶¶ 14 and 31.

1 Contrary to Gen-Probe's contentions, however, Example 5 of the '338 patent does disclose  
2 the use of a specific primer. In particular, while Example 5 states initially that random oligohexamer  
3 primers can be used to achieve non-specific amplification, Example 5 also discloses that  
4 "[a]lternatively, the double stranded DNA can be formed by synthesis starting from capture probe  
5 a." Col. 31, lines 48-49. In this instance, the capture probe acts as the primer. Since the capture  
6 probe binds specifically to the target DNA, the capture probe would be a specific primer to the  
7 target. This is an example of specific amplification because the primer, capture probe a, binds to a  
8 specific, unique DNA sequence in the target organism. Persing Decl., ¶ 13.

9 The most that can be said of the specification of the '338 patent in support of Gen-Probe's  
10 position is that it describes specific amplification as not being the preferred embodiment of the  
11 invention. It is well settled, however, that patent claims should not be read as excluding disclosed  
12 but not preferred embodiments of the invention. *Tate Access Floors, Inc. v. Maxcess Technologies,*  
13 *Inc.*, 222 F.3d 958, 966 (Fed. Cir. 2000)

14 **2. Gen-Probe's Cited Authority Relates to Descriptions of The Invention**  
15 **Using Mandatory Rather Than Permissive Language**

16 The cases relied on by Gen-Probe in support of its argument are easily distinguishable in that  
17 each involved a patent specification that described a particular embodiment not as a preferred  
18 embodiment, but as the invention itself. In *Wang Laboratories, Inc. v. America Online, Inc.*, 197  
19 F.3d 1377 (Fed. Cir. 1999), the patent specification always described the disputed term "frame" as  
20 being specific to "characters." Thus, the court concluded that the term included "character-based  
21 systems" but not "bit-mapped display systems." *Wang* at 1381. In contrast to *Wang*, the '338 patent  
22 specification clearly describes the embodiment of non-specific amplification in permissive and not  
23 mandatory language. Moreover, in *Wang*, unlike here, the only mention in the specification of the  
24 alternative embodiment ("bit-mapped display systems") was in the Background of the Invention,  
25 which the court viewed as simply an acknowledgement of the state of the art and not an enlargement  
26 of the invention. *Wang* at 1382. In contrast, here specific amplification is described in the patent  
27 examples.

28

1 Finally, the prosecution history in *Wang* supported the limitation to character-based frames.  
2 During prosecution the patent applicant had distinguished prior art on the basis that it “encodes  
3 pictorial information . . . on the pel [picture element] level, rather than on the character level.” *Wang*  
4 at 1384. Here, in contrast, the prosecution history makes it clear that the Patent Office (five different  
5 Patent Examiners) and the patent owner all considered the embodiment that Gen-Probe argues  
6 should be excluded from the claim, specific amplification, to be within the scope of the claimed  
7 invention.

8 In *Scimed Life Systems, Inc. v. Advanced Cardiovascular Systems, Inc.*, 242 F.3d 1337 (Fed.  
9 Cir. 2001), also relied on by Gen-Probe, the patent specification unequivocally described the  
10 embodiment of a **coaxial** lumen structure as the “basic sleeve structure for all embodiments of the  
11 present invention contemplated and disclosed herein.” *Scimed* at 1339. The court added that “from  
12 the outset the specification identifies the inflation lumen, as that term is used in the Scimed patents,  
13 as annular, i.e., **coaxial** rather than **dual** in structure.” *Scimed* at 1342 (emphasis added).

14 Accordingly, the court limited the scope of the asserted claims to catheters with **coaxial** lumens and  
15 held that the patent disclaimed **dual** lumens. *Scimed* at 1340. In contrast to the ‘338 specification,  
16 the specification in *Scimed* used mandatory rather than permissive language making it clear that the  
17 invention was the use of coaxial lumens, not dual lumens. Also, unlike the present case, the  
18 specification in *Scimed* distinguished the invention from prior art that disclosed dual lumens and  
19 pointed out the advantages of coaxial lumens. *Scimed* at 1342-43. Finally, unlike here, the court  
20 noted that there was nothing pertinent to the issue of claim construction in the prosecution history.  
21 *Scimed* at 1340.

22 In *O.I. Corp. v. Tekmar Co.*, 115 F.3d 1576 (Fed. Cir. 1997), also relied on by Gen-  
23 Probe, the issue was the proper meaning of the claim term “passage.” All of the “passage”  
24 structures contemplated by the specification were either non-smooth or conical. In addition,  
25 the specification distinguished the invention from prior art geometries by stating:

26  
27 A number of **different geometries** for the second section **are contemplated**,  
28 including those having an **irregular shaped** surface or **noncylindrical** shape. **In**  
**contrast**, the **prior art** has generally specified that the pneumatic tubing and  
passageways between the trap and GC are **smooth-walled**.

1 *O.I. Corp.* at 1581 (emphasis added). Thus, *O.I. Corp.* is easily distinguishable from this case.  
2 Here, the specification of the '338 patent did not distinguish the invention from prior art disclosing  
3 specific amplification.<sup>5</sup> The *O.I. Corp.* court also noted that there was nothing identified in the  
4 prosecution history contrary to these limiting statements. Based on the specification, the court held  
5 that the term "passage" did not encompass a smooth-walled, completely cylindrical structure. *O.I.*  
6 *Corp.* at 1581.

7 *Kraft Foods, Inc. v. International Trading Co.*, 203 F.3d 1362 (Fed. Cir. 2000), also relied on  
8 by Gen-Probe, is also readily distinguishable from this case. In that case, the court relied on the  
9 unequivocal statement in the patent specification that "any of the back panels would be constructed  
10 of a relatively stiff material" in holding that the claimed "back panel" needed to be "relatively stiff."  
11 *Kraft* at 1367. The language in the specification in *Kraft* was mandatory, rather than permissive as  
12 in this case. Moreover, in *Kraft*, the prosecution history supported the narrow claim construction  
13 because the examiner acknowledged during prosecution that the specification provided a description  
14 of the back panel material as being stiff. *Kraft* at 1369.

15 Because the specification of the '338 patent describes non-specific amplification with  
16 permissive rather than mandatory language and also describes the use of specific amplification, the  
17 '338 patent specification differs significantly from the specifications in the cases relied on by Gen-  
18 Probe, which described a particular embodiment as **being** the invention. The specification of the  
19 '338 patent simply points out the benefits of the invention in **permitting** the use of non-specific  
20 amplification. It does not limit the invention to non-specific amplification and does not exclude  
21 specific amplification. Those skilled in the art reading the '338 patent specification would  
22 understand that the invention includes specific amplification. Persing Decl., ¶¶ 7, 19.

23  
24  
25  
26  
27 <sup>5</sup> In fact, when faced with rejections based on prior art disclosing PCR, a type of specific  
28 amplification, the owner of the '338 patent declined to limit the invention to exclude specific  
amplification and instead acknowledged that the invention included PCR.

1           **D.     Gen-Probe's Extrinsic Evidence Should Be Given No Weight**

2                   **1.     The Falkinham Declaration Should Be Given No Weight Because He Did**  
3                   **Not Consider The Prosecution History**

4           Gen-Probe relies on a declaration by Joseph Falkinham stating his opinion that one of  
5 ordinary skill in the art would have understood the term "amplifying" as used in the claims of the  
6 '338 patent to mean amplifying by use of non-specific amplification, and would not have understood  
7 the term "amplifying" to mean amplifying by use of sequence-specific amplification methods.  
8 Falkinham Decl., ¶¶ 5, 52. Dr. Falkinham's declaration should be given little, if any, weight,  
9 however, because it is based only on a review of the specification and claims of the '338 patent, and  
10 did not consider the prosecution history of the '338 patent. Falkinham Decl., ¶ 4. Moreover, the  
11 Falkinham declaration is based on a factually incorrect allegation that use of specific primers is not  
12 disclosed in the '338 patent. Persing Decl., ¶ 13.

13           In contrast, Vysis submits herewith the declaration of its expert, Dr. David H. Persing, based  
14 on a full consideration of all of the intrinsic evidence, which the Federal Circuit has stated will in  
15 most instances alone resolve any ambiguity in a disputed claim term. *Vitronics*, 90 F.3d at 1583.  
16 Dr. Persing, after considering the claims, specification, and pertinent prosecution history of the '338  
17 patent, disagrees with Dr. Falkinham and states that, in his opinion, the '338 patent claims include  
18 specific types of amplification. Persing Decl. ¶¶ 4, 6, 7, 19. Dr. Persing bases that opinion on (a)  
19 his belief that those of ordinary skill in the art as of December 21, 1987 reading the specification of  
20 the '338 patent would conclude that the term "amplify" as used in the claims of the '338 patent  
21 includes specific amplification, and (b) his review of the prosecution history of the '338 patent  
22 showing that both the patent owner and the patent examiners considered the invention to encompass  
23 specific amplification techniques such as PCR. Persing Decl. ¶¶ 8-18.

1                   2.     **The Testimony Of The Patent Owner's Ex-Employees Should Be Given**  
2                                   **No Weight**

3                   Gen-Probe relies heavily on testimony of two former employees of Vysis' predecessor  
4 company Gene-Trak Systems -- Jon Lawrie, one of the inventors of the '338 patent, and Jim  
5 Richards, a business development person. According to the Federal Circuit, this testimony should be  
6 given little, if any, weight:

7                   **[t]he subjective intent of the inventor when he used a particular term is of little or**  
8                   **no probative weight in determining the scope of a claim (except as documented in**  
9                   **the prosecution history). . . . it is not unusual for there to be a significant difference**  
                  between what an inventor thinks his patented invention is and what the ultimate scope  
                  of the claims is after allowance by the PTO.

10                  *Markman*, 52 F.3d at 985.

11                  Thus, the testimony of inventor Lawrie is simply irrelevant to the claim construction issue.  
12 Moreover, Gen-Probe relies on only some of Dr. Lawrie's testimony while ignoring other testimony.  
13 For example, Gen-Probe cites testimony from Dr. Lawrie that the '338 patent was directed to  
14 methods separate from PCR, but ignores Dr. Lawrie's testimony that he believed that the invention  
15 of the '338 patent "is not limited to nonspecific amplification." Banks Decl., Ex. H, p. 262, lns. 8-  
16 14.

17                  Gen-Probe also relies heavily on a document authored by Jim Richards and testimony from  
18 Richards about that document purportedly relating to the invention of the '338 patent. This  
19 document and the Richards testimony are utterly irrelevant to the claim construction issue. First of  
20 all, Jim Richards is not even an inventor of the '338 patent, and in fact worked in business  
21 development. Moreover, at his deposition, Richards testified that at the time he authored the  
22 document Gen-Probe relies on, he had not even read the patent application that eventually issued as  
23 the '338 patent. Banks Decl., Ex. I, p. 184, lns. 7-9.

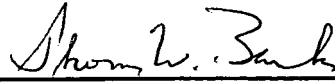

24                  Accordingly, the testimony of these ex-employees should have no bearing on the proper  
25 interpretation of the '338 patent claims.

1 **III. CONCLUSION**

2 For the reasons pointed out herein, Gen-Probe's motion should be denied.
